Figure 2: Three versions of assembly code for the C code of Figure ??

Question 4 (20 points): Figure ?? shows a simple function written in C. Figure ?? shows three versions of MIPS assembly code that attempt to implement the function of Figure ??.

a. (5 points Do all three versions of the assembly code correctly implement the C code? If not, explain any incorrections.

b. (7 points) Using the letters A, B, and C, provide a sorted list of the three versions according to their efficiency. List first the least efficient and list last the most efficient version. Explain the criteria that you used for sorting.

c. (8 points) Assume that the least efficient implementation is the baseline for comparison. For the other two, starting at the least efficient and moving to the most efficient version, briefly explain what the programmer, or compiler, did to the implementation to make it more efficient than the previous one.
