## Question 3 (30 points):

NVIDIA has defined a "half-precision" floating pointing format for use in its Graphics Processing Units (GPUs). A floating-point number is represented in this format in 16 bits as follows: the most significant bit is the sign bit, next there are 5 bits used for the exponent, and 10 bits for the fraction. This format is illustrated below:

15	14		10	9		0
S		*exponent*			*fraction*	
The exponent is expressed in excess-16 format (also known as a bias representation). Given the binary representation above, the decimal value of the number represented can be computed by the following expression:

$$
N \;=\;
\begin{cases}
(-1)^S \times 0.0 & \text{if } exponent = 0 \text{ and } fraction = 0 \\
(-1)^S \times 0.fraction \times 2^{-14} & \text{if } exponent = 0 \text{ and } fraction \neq 0 \\
(-1)^S \times 1.fraction \times 2^{exponent-15} & \text{if } 0 < exponent < 31 \\
(-1)^S \times \infty & \text{if } exponent = 31 \text{ and } fraction = 0 \\
NaN & \text{if } exponent = 31 \text{ and } fraction \neq 0
\end{cases}
$$

a. (**8 points**) Give the bit pattern for the representation of the number -4.125_{10} in this notation.

15	14		10	9		0
Let `A = 0x7800` and $B = 0x4D00$ be two floating pointing numbers in this format.

b. (**8 points**) What is the value of `A` and the value of `B`? Express each of these values both in normalized base-two notation and in decimal notation.

A =

15	14		10	9		0

B =

15	14		10	9		0
c. **4 points**) What is the true value of $A + B$ expressed in decimal notation? In other words, what is the value of $A + B$ if an infinite precision could be used to compute the addition and to store the result?

d. (**5 points**) Assume a floating-point unit uses the NVIDIA format presented above. This unit has no guard, no round, and no sticky bits. What is the value of $A + B$, expressed both in normalized base-two notation and in decimal notation, computed by this machine?

e. (**5 points**) Assume a floating-point unit uses the NVIDIA format presented above. This unit has one guard, one round, and one sticky bit. What is the value of $A + B$, expressed in normalized base-two notation, computed by this machine?
